The human apolipoprotein(a) kringle domains IV36 (LK6 protein), IV37 (LK7 protein) and V38 (LK8 protein) together form the angiogenesis inhibitor, LK68 protein. LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo chorioallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans. LK68 is useful as an anticancer agent ar also for inhibiting primary tumour growth.
This sequence represents the kringle 5 domain of human apolipoprotein (apo(a)), which was used to generate monoclonal antibodies. Apo(a) is characteristic glycoprotein component of lipoprotein(a) (Lp(a)), which
                                                                                                                                                                                                                                                                                                                              Apolipoprotein A; apo(a); glycoprotein; heart disease; detection; diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       片
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lp(a) and LDL are both associated with premature coronary heart disease.

Increased Lp(a) concentrations may inhibit fibrinolysis by reducing the generation of plasmin. This may be effected by competition for plasminogen cell-surface receptors, by inhibition of activation of plasminogen, or by competition for binding sites on fibrin. Anti-apo(a) antibodies can be used in a novel method of Lp(a) quantitation. Such antibodies are not cross-reactive with plasminogen, LpL, and the various types of apo(a) kringle 4 domains. Previous methods of Lp(a) immunoassay used antibodies that bind to the apo(a) kringle 4 domain, which is present in multiple copies. One method, TERUMO ELISA (enzyme-linked immunoarbent assay), tended to produce erroneous results with cardiac and diabetic patients, especially those with very high Lp(a) concentrations (greater than 50 mg/dL). Apo(a) monoclonal antibodies may serve as accurate markers for the detection and diagnosis of heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

LK68 protein contains the amino acid sequences of human applipoprotein(a) kringle domains IV36 (LK6 protein), IV37 (LK7 protein) and V38 (LK8 protein). LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo chorioallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psoriasis or ocular angiogenic disease in animals or humans.

LK68 is useful as an anticancer agent and also for inhibiting primary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This hybrid plasminogen/u-PA sequence is described in the specification although the sequence itself is not given. The sequence given here has been compiled using the human plasminogen sequence from Patent No. WO9013640 and the human u-PA sequence from the SWISSPROT database (UROX$HUMAN). The hybrid fibrinolytic enzymes are useful in the treatment of thrombotic diseases. See also R22499, R22502 and R22503.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hybrid plasminogen activators for treating thrombotic comprise Kringle 5 or Kringles 4 and 5 of plasminogen B-chain of t-PA or u-PA via aminoacid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This hybrid plasminogen/u-PA sequence is described in the specification although the sequence itself is not given. The sequence given here has been compiled using the human plasminogen sequence from Patent No. WO9013640 and the human u-PA sequence from the SWISSPROT database (UROKSHUMAN). The hybrid fibrinolytic enzymes are useful in the treatment of thrombotic diseases. See also R22499, R22502 and R22504.

Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating

The method comprises contacting plasminogen with a sulfydryl donor, or culturing cells capable of producing plasminogen activator in conditioned culture medium (CCM) and contacting the CCM with plasminogen. Angiostatin produced by method of the invention is useful for treating animals with angiogenesis diseases. It is useful for treating an angiogenic disease such as neoplastic diseases (e.g. tumours and tumour metastasis), benign tumours (e.g. hemangiomas, acoustic neuromas, etc), connective tissue disorders (e.g. rheumatoid arthritis and atherosclerosis), ocular angiogenic diseases (e.g. diabetic retinopathy, corneal graft rejection, etc), cardiovascular diseases, correbral vascular diseases, diabetes-associated diseases and immune disorders (e.g. chronic inflammation and autoimmunity). The present corresponders (e.g. chronic inflammation and autoimmunity).

The MBEs interact independently with thermodynamic additivity, with components of the vascular endothelium. (I) provide targeted delivery of the anti-angiogenic polypeptide to cell membranes and sites of active angiogenesis, particularly the vascular endothelium, and therefore increase the local concentration and reduce the risk of adverse effects on normal processes elsewhere in the vasculature. They are used in a claimed method of treatment of primary or secondary tumour.
The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract,

They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatcoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The poptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01906-B01919 represent fragments of human plasminogen used in an exemplification of the invention.

Note: This sequence is not shown in the specification, but is derived from the full length human plasminogen sequence (AAB01887) shown in
                                                                                         Preparation of Kringle five peptide fragment for treating various disorders such as anglogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasminogen; human; kringle domain; endothelial cell proliferation; angiogenesis; antiproliferative; antiarteriosclerotic; cytostatic; antipsoriatic; antiinflammatory; antiulcer; antirheumatic; antiarthritic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC endothelial cell proliferation and migration. The peptides are useful CC for treating angiogenic diseases, primary and metastatic solid tumours CC and carcinomas of various organs such as breast, genital tract, CC andocrine glands, skin, tumours of the brain and eyes and solid tumours CC lymphomas. They are also used for the prophylaxis of various autoimmune CC lymphomas. They are also used for the prophylaxis of various autoimmune CC diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber CC syndrome), diseases caused by excessive or abnormal stimulation of CC which have angiogenesis as a pathologic consequence (e.g., cat scratch CC disease and ulcers). The peptides are also useful as a birth control CC disease habologic—souls in an exemplification of the intention.

CC Sequences AABO1906-B01919 represent fragments of human plasminogen used of the placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g., haematoidas, Osler-Webber conditions).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis are the consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01906-B01919 represent fragments of human plasminogen used
                                                                                                                                                                                                                                                            03-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 joints, wound granulation, ulcers etc., also as contraceptives that inhibit ovulation and establishment of the placenta. K5 antisers or (ant)agonists can be used similarly, optionally coupled to cytotoxic agents. Antagonists may be used to induce angiogenesis, e.g. for woun healing. The K5 peptides are also used to raise specific antibodies (for diagnosis and for affinity purification of K5 receptors. The K5 receptors may then be expressed in tumour cells to increase their response to the peptides or used for identification of smaller antagonists. The Ab are used to detect/quantify the peptides in biological samples. The K5 peptides (and K5 fusion proteins) selective inhibit proliferation of endothelial cells with low toxicity against normal cells. Typically they have 800-times greater inhibitory activity against bovine capillary cells in vitro than kringle 1-4 peptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a kringle 5 (K5) peptide homologous to human plasminogen. K5 peptide fragments homologous to this sequence, are anti-angiogenesis agents, specifically for treating or preventing cancer, particularly primary or metastatic solid tumours, carcinomas, sarcomas, lymphomas, haemangiomas. They can also be used for treating or preventing psoriasis, arthritis, macular degeneration and diabetic retinopathy. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammallan plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber typhomas and diseases cannot be prophylaxis of various autoimmune diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber typhomas and diseases cannot be prophylaxis of various autoimmune diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber typhomas and diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber typhomas and diseases (e.g., psoriasis), blood vessel diseases (e.g., haemangiomas, Osler-Webber typhomas and typhom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plasminogen; human; kringle domain; endothelial cell proliferation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Syndrome), diseases caused by excessive or abnormal stimulation of endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01890-B01894 represent, respectively, human, murine, Rhesus monkey, bovine and porcine plasminogen kringle 5 domains.

the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and ymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, osler-Webber (e.g., psoriasis), crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta.

Sequences AAB01906-B01919 represent fragments of human plasminogen used
                                                                        Sequences AAB01906-B01919 represent fragments of human plasm
in an exemplification of the invention.

Note: This sequence is not shown in the specification, but if the full length human plasminogen sequence (AAB01887)

CC peptide fragments. The method comprises mixing mammalian plasminogen and
CC elastase in the ratio 1:100-1:300, followed by incubating and isolating
CC the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
CC endothelial cell proliferation and migration. The peptides are useful
CC for treating angiogenic diseases, primary and metastatic solid tumours
CC endocrine glands, skin, tumours of the brain and eyes and solid tumours
CC arising from haematopoietic malignancies such as leukaemias and
CC lymphomas. They are also used for the prophylaxis of various autoimmune
CC diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases
CC (e.g., psoriasis), blood vessel diseases (e.g. haemangiomas, Osler-Webber
CC Syndrome), diseases caused by excessive or abnormal stimulation of
CC endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases
CC which have angiogenesis as a pathologic consequence (e.g., cat scratch
CC disease and ulcers). The peptides are also useful as a birth control
CC agent which inhibits ovulation and establishment of the placenta.
CC sequences AAB01906-B01919 represent fragments of human plasminogen used
CC in an exemplification of the invention.

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score
